Report Overview

A desuperheater is a device used in the liquefied natural gas (LNG) industry to reduce the temperature of superheated steam or gas. LNG is natural gas that has been cooled to its liquid state for ease of storage and transportation. During the process of regasification or when transferring LNG from one container to another, high-pressure steam or gas may be generated, which needs to be cooled down to a desired temperature range. A desuperheater typically includes a heat exchanger that removes excess heat from the superheated steam or gas. By transferring heat to a cooling medium, such as water or refrigerants, the desuperheater brings the temperature of the steam or gas down to the desired level. It helps prevent damage to downstream equipment and ensures optimal efficiency in LNG processes.

The global Liquified Natural Gas (Lng) Desuperheater market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
