Abstracts

Lithium battery electrolyte is a vital component of lithium-ion batteries, serving as the conductive medium that enables the movement of lithium ions between the cathode and anode during charging and discharging cycles. It typically consists of a lithium salt, such as lithium hexafluorophosphate (LiPF₆), dissolved in a mixture of organic carbonates like ethylene carbonate (EC) and dimethyl carbonate (DMC), and may include various additives to enhance performance, safety, and longevity. The electrolyte must possess high ionic conductivity, electrochemical stability, thermal resilience, and compatibility with electrode materials while remaining non-flammable or flame-retardant to mitigate risks of thermal runaway. Its formulation directly impacts key battery characteristics, including energy density, cycle life, operational temperature range, and safety profiles, making it a critical area of innovation as battery technology evolves.

The global Lithium Battery Electrolyte market size was estimated at USD 5200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
