Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Lithium Carbon Composite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Lithium carbon composites are a new type of advanced material formed by physically or chemically combining lithium metal (usually lithium foil, lithium powder, or pre-lithiated form) with specific carbon-based materials (such as graphene, carbon nanotubes, carbon fibers, porous carbon, and graphite). These materials utilize the carbon materials' excellent structural stability, high conductivity, large specific surface area, and tunable pore structure to accommodate the lithium metal, suppressing the growth of lithium dendrites and significant volume changes during charge and discharge. This significantly improves the cycling stability and safety of the lithium metal anode while maintaining its high theoretical specific capacity. They hold broad application prospects in the lithium battery field. Globally, with the rapidly growing demand for higher energy density, longer driving range, and faster charging in electric vehicles, consumer electronics, and energy storage systems, lithium-carbon composites (LCCs) are attracting significant attention and investment from both academia and industry as promising materials that could address the critical bottleneck of lithium metal anodes. In the field of solid-state batteries, in particular, LCCs are considered a key path to commercialization. The market is currently in the early stages of technological breakthroughs and industrialization, facing challenges such as uniform composite processing, cost control, and interfacial stability with the electrolyte. However, their enormous market potential has attracted significant venture capital and government R&D funding. As technologies like solid-state batteries mature, the LCC market is expected to experience explosive growth over the next decade, becoming a key material driving the next generation of battery technology, and the market size is

expected to expand rapidly. Competition in R&D and industrialization in this field is particularly fierce in China, Japan, South Korea, the United States, and Europe.

The global Lithium Carbon Composite market size was estimated at USD 87.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 32.60% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Lithium Carbon Composite market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
