### Report Overview

Lithium-Ion Battery Dry Separator can be subdivided into uniaxial stretching processes and biaxial stretching processes. The dry uniaxial stretching process is to prepare a low-crystallinity highly oriented polypropylene or polyethylene film by producing hard elastic fibers, and obtain a high-crystallinity film during the high-temperature annealing process. This film is first stretched at low temperatures to form micro-defects, and then at high temperatures the defects are pulled apart to form micropores. The performance of the separator in the dry biaxial stretching process is poor, and it can only be used for low-end batteries. Therefore, the dry uniaxial stretching process and the wet process are currently the mainstream preparation processes.

The global Lithium Ion Battery Dry Separator market size was estimated at USD 4625.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.45% during the forecast period.
