Abstracts

Lithocholic acid is a secondary bile acid that forms in the human digestive system as a result of bacterial metabolism of primary bile acids, such as chenodeoxycholic acid. It is also found in trace amounts in the bile of humans and some animals. Lithocholic acid plays a role in lipid digestion and absorption, aiding in the emulsification and solubilization of dietary fats. In medicine, it has been used as a pharmaceutical agent to dissolve certain types of gallstones. However, its use is limited due to potential toxicity at higher concentrations and the availability of safer alternatives. The industry trend for lithocholic acid is relatively limited due to its narrow range of applications and potential safety concerns. While it has been used in the past for gallstone dissolution, its usage has declined over time in favor of more effective and safer treatments. Research and development efforts have focused on alternative bile acids and therapies for gallstone management. Therefore, the industry trend for lithocholic acid is relatively stagnant, with its role primarily confined to historical medical practices and limited pharmaceutical applications.

The global Lithocholic Acid market size was estimated at USD 71.7 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
