Report Overview

Live attenuated vaccines are a type of immunization that uses a weakened but live form of the pathogen (virus or bacteria) to stimulate a strong and long-lasting immune response without causing the actual disease. These vaccines closely mimic natural infections, leading to robust cellular and antibody-mediated immunity, often requiring fewer doses compared to inactivated vaccines. Examples include vaccines for measles, mumps, rubella (MMR), yellow fever, and varicella (chickenpox). While highly effective, they may pose risks for immunocompromised individuals, as the weakened pathogen could potentially cause disease in those with weakened immune systems. The development and production of live attenuated vaccines involve complex processes, including pathogen attenuation through serial passage or genetic modification, ensuring safety while maintaining immunogenicity. Their stability and potential for single-dose administration make them valuable in global immunization programs, particularly in resource-limited settings.

The global Live Attenuated Vaccines market size was estimated at USD 31070.08 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.16% during the forecast period.
