## Abstracts

A live bottom system trailer is a specially designed transport vehicle, mainly used to transport bulk materials or large cargoes. The chassis and frame are usually made of high-strength steel to withstand the weight of the cargo and various stresses during transportation. The shape and size of the frame are designed according to the purpose and load-bearing capacity of the trailer, and generally have good stability and rigidity to ensure that it will not deform during driving. For example, in a live bottom trailer that transports ore in a large mine, the strength of its frame must be able to withstand the weight of dozens or even hundreds of tons of ore. The live bottom can be opened and closed flexibly, and there are various ways to open it, the most common of which are hydraulic drive and mechanical drive (such as chain, gear, etc.). The hydraulically driven live bottom system can achieve smooth and precise opening and closing movements. By controlling the pressure and flow of the hydraulic system, the opening speed and angle of the live bottom can be adjusted. In a trailer that transports sand and gravel for construction, when unloading is required, the hydraulic live bottom can be opened quickly so that the sand and gravel can be unloaded smoothly. With the advancement of agricultural modernization, the demand for agricultural product transportation continues to increase. The live-bottom system trailer can better adapt to the transportation of bulk agricultural products such as grains and feed, improve loading and unloading efficiency, and reduce the loss of agricultural products during transportation. Its application in the agricultural field is expected to expand further. Against the background of the continuous development of infrastructure construction and mining, the demand for the transportation of materials such as building materials and ores remains strong. The large capacity and efficient unloading function of the live-bottom system trailer will keep its market share in the construction and mining fields stable, and with the advancement of technology, its adaptability and reliability under complex working conditions will continue to improve. The increase in environmental

awareness has prompted countries to increase their investment in waste treatment and resource recycling. The live-bottom system trailer can conveniently transport domestic waste, construction waste, industrial waste, etc., and can quickly unload at the waste treatment site to improve waste treatment efficiency. Therefore, it has broad application prospects in the field of waste treatment and recycling. More and more live-bottom system trailers are equipped with advanced on-board information systems, which can monitor the vehicle's driving status, cargo weight, tire pressure and other key parameters in real time, provide accurate information to the driver, help him optimize driving behavior, and improve transportation efficiency and safety. In the unloading process, the degree of automation continues to increase. Through sensors and control systems, the live bottom can automatically adjust the angle and vibration intensity according to the residual conditions of the cargo, ensuring thorough unloading and reducing manual intervention and labor intensity.

The global Live Bottom System Trailer market size was estimated at USD 426.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
