## Abstracts

Live Brucellosis Vaccine is a kind of vaccine used to prevent brucellosis, which is also known as Malta fever or undulant fever. It is a live attenuated vaccine prepared from weakened strains of Brucella bacteria. The attenuated Brucella strains in the live vaccine still retain certain antigenicity, which can stimulate the body's immune system to produce a relatively strong immune response, inducing the production of specific antibodies and cell-mediated immune responses, thereby providing effective protection for the body to prevent the occurrence of brucellosis. The attenuated strains in the live vaccine can replicate to a limited extent in the body, allowing the body's immune system to be continuously stimulated by antigens, resulting in more long-lasting immunity and extending the duration of immune protection.

The global Live Brucellosis Vaccine market size was estimated at USD 193.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
