Report Overview:

A live poultry vaccine is a type of biological preparation used for preventing avian influenza outbreaks in chicken flocks. It contains attenuated strains of avian influenza virus and works by triggering immune responses against viral antigens present in sick birds without causing disease symptoms or death. Unlike conventional dead virus-based vaccines, live poultry vaccines require refrigerated storage and prompt administration after opening for best efficacy. Administered via drinking water or spray application methods, they typically provide protection lasting up to six months per dose depending on local environmental stressors and target pathogens. Their use represents one component in overall control strategies combatting the spread of bird flu among commercial poultry farms worldwide.

The Global Live Poultry Vaccine Market Size was estimated at USD 1711.62 million in 2023 and is projected to reach USD 2228.97 million by 2029, exhibiting a CAGR of 4.50% during the forecast period.
