Abstracts

Livestock anti-infective medicine refers to medications and treatments used to prevent, control, or treat infectious diseases in livestock animals. These medications are employed to combat bacterial, viral, fungal, and parasitic infections that can pose a threat to animal health and productivity. Antibiotics are used to treat bacterial infections in livestock, such as respiratory tract infections, mastitis, and wound infections. They work by killing or inhibiting the growth of bacteria. Different classes of antibiotics are available, and the choice depends on the specific bacteria and the type of infection. Antiviral drugs are used to treat viral infections in livestock, including diseases like foot-and-mouth disease and bovine viral diarrhea. They work by inhibiting the replication or spread of viruses, helping to control the infection. Antifungal medications are used to treat fungal infections in livestock, such as ringworm or thrush. These medications target and kill the fungi responsible for the infection. These medications are used to control and eliminate internal and external parasites in livestock, such as worms, ticks, lice, or mites. They come in various forms, including oral drenches, injectables, pour-ons, or topical sprays.
