Abstracts

Livestock external parasiticides refer to medications or treatments used to control and eliminate external parasites in livestock, such as fleas, ticks, mites, lice, flies, and other pests. These parasites can cause discomfort, skin irritation, transmit diseases, and reduce the productivity and welfare of livestock. External parasiticides help manage and control these pests, improving the health and well-being of the animals. Insecticides are chemicals or compounds formulated to kill or repel insects. They are commonly used to control flies, ticks, fleas, lice, and other insects that infest livestock. Insecticides may be available as sprays, pour-ons, dusts, dips, or ear tags and should be applied according to label instructions and appropriate dosage. It is important to follow label instructions, adhere to withdrawal periods, and consult with a veterinarian or agricultural specialist for guidance on the selection and correct use of livestock external parasiticides. Proper management practices such as maintaining clean and sanitary living conditions, reducing the parasite burden, and implementing integrated pest management strategies can further support effective external parasite control in livestock.

The global Livestock External Parasiticide market size was estimated at USD 2827.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
