Report Overview

The feeding robot travels on a rail across the farm to feed additives to cattle, swine, horses, poultry animals. The feeding robot docks onto a power rail in order to charge the batteries and to be able to drive into the feed kitchen and carry out mixing on mains voltage. This gives the robot extra capacity and prolongs the lifespan of the batteries. To navigate, the robot uses an antenna that follows an induction wire or transponders in the floor. This makes it possible to operate without any need for a rail, even between different buildings and across farmyards.
