Abstracts

Livestock internal parasiticides are medications or treatments used to control and eliminate internal parasites in various species of livestock, including cattle, sheep, goats, pigs, and poultry. Internal parasites, such as worms (helminths) or protozoa, can infest the gastrointestinal tract or other internal organs of livestock, leading to reduced productivity, poor growth, and potential health issues. Internal parasiticides help manage and control these parasites, improving the health and well-being of the livestock. Anthelmintics are medications specifically designed to target and eliminate worms in livestock. These medications may be broad-spectrum, effective against a wide range of worms, or narrow-spectrum, targeting specific types of worms. Anthelmintics can be administered orally, as drenches, injections, or in feed additives. Some internal parasiticides are formulated as oral suspensions, which can be mixed with feed or water for easier administration to livestock. These suspensions may contain a combination of anthelmintics or other medications to target multiple types of internal parasites.

The global Livestock Internal Parasiticide market size was estimated at USD 4249.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
