Abstracts

Pain management in livestock is an important aspect of animal welfare and responsible livestock care. Recognizing and addressing pain in livestock is essential to ensure their well-being and minimize unnecessary suffering. Veterinary clinicians may prescribe analgesic medications, such as nonsteroidal anti-inflammatory drugs (NSAIDs) or opioids, to manage pain in livestock. These medications help reduce inflammation and provide pain relief. Providing suitable housing, flooring, bedding, and access to clean water and appropriate nutrition can contribute to the overall comfort and well-being of livestock, enhancing pain management. Attention to temperature control, ventilation, and disease prevention measures also play a role in reducing pain. Implementing low-stress handling techniques, using positive reinforcement, and providing environmental enrichment can help reduce fear and stress in livestock, leading to improved pain management.

The global Livestock Pain Management market size was estimated at USD 1877.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
