## Abstracts

Liquefied natural gas (LNG) refueling stations are specialized infrastructure facilities designed to store, process, and dispense LNG as a fuel for heavy-duty vehicles, marine vessels, and other industrial applications. These stations operate by receiving LNG via cryogenic tanker trucks or pipelines, maintaining it at extremely low temperatures (approximately -162°C) in insulated storage tanks, and using high-pressure pumps to vaporize and dispense the fuel into vehicles equipped with LNG-compatible engines. The primary function of these stations is to enable the use of LNG as a cleaner-burning alternative to diesel, reducing emissions of pollutants such as nitrogen oxides, sulfur oxides, and particulate matter, while also offering potential cost savings and energy security benefits in regions with abundant natural gas resources.

The global Lng Refueling Stations market size was estimated at USD 3850.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.75% during the forecast period.
