Abstracts

Lithium Nickel Manganese Oxide (LNMO) battery materials refer to a class of cathode materials for lithium-ion batteries that utilize a spinel crystal structure with the chemical formula $\text{LiNi}_{1-x}\text{Mn}_x\text{O}_2$, characterized by high operating voltage (~4.7 V vs. Li/Li^+), excellent rate capability, and thermal stability. These materials offer a compelling alternative to conventional cathodes like NMC (Lithium Nickel Manganese Cobalt Oxide) and LFP (Lithium Iron Phosphate) due to their cobalt-free composition, which reduces cost and supply chain vulnerabilities, while their high energy density and fast-charging potential make them suitable for applications demanding high power and efficiency, such as electric vehicles and grid storage systems. However, challenges related to electrolyte compatibility at high voltages and manganese dissolution during cycling remain key technical hurdles impacting long-term cycle life and commercialization.

The global Lnmo Battery Materials market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
