Abstracts

Lipid nanoparticles (LNPs) are the most advanced non-viral gene delivery systems in clinical practice. Lipid nanoparticles can overcome a major obstacle in the development and application of genetic drugs, and safely and effectively transport nucleic acids. Gene drugs have many different application fields, such as gene editing, rapid vaccine development, tumor immunotherapy for rare genetic diseases and non-drug-resistant diseases, and so on; All of these application areas are often hindered by low efficiency in nucleic acid delivery. LNP consists of four components: ionized lipid phospholipids, PEG lipids, cholesterol like structures, and lipids. These four components form a sphere with a diameter of about 100 nm, which can encapsulate mRNA, siRNA, and gene editing scissors and deliver them into the LNP sphere. The most critical component of LNP is ionized lipids, which are the key components for LNP to escape from its inner body. The new development of medicine has made drugs and their active ingredients increasingly complex and brought new challenges. For example, oligonucleotides are easily degraded in the human body. The latest research suggests that LNPs can form a stable environment for protecting active ingredients such as RNA, mRNA, siRNA, or DNA based APIs. The optimization of nucleic acid drugs and targeted cell delivery pathways is currently a very popular research field. Lipid nanoparticles (LNPs) are commonly used to encapsulate and deliver drugs such as mRNA. The LNP production equipment is used for the preparation and production of these lipid nanoparticles.

The global LNP Synthesis System market size was estimated at USD 69.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.00% during the forecast period.
