Abstracts

A Load Reduced Dual Inline Memory Module (LRDIMM) is an advanced type of server memory module designed to address the signal integrity and capacity limitations of traditional Registered DIMMs (RDIMMs) in high-density computing environments. Unlike RDIMMs, which use registers to buffer only the command and address signals, LRDIMMs incorporate a memory buffer (MB) chip that isolates the memory controller from the DRAM chips by buffering both data and command/address signals. This buffer significantly reduces the electrical load on the memory bus, allowing systems to support a greater number of memory modules per channel without degrading signal quality or performance. As a result, LRDIMMs enable higher memory capacities, improved scalability, and better power efficiency in enterprise servers, data centers, and high-performance computing systems, making them particularly suited for applications requiring large amounts of reliable, high-bandwidth memory.

The global Load Reduced Dimm (Lrdimm) market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
