Abstracts

A lockable indexing plunger is a specialized mechanical device used for precise positioning and secure locking in industrial applications, typically consisting of a spring-loaded plunger that engages with pre-drilled holes or notches in a mating component. It combines the functions of a standard indexing plunger?which allows for repeatable positioning by retracting to disengage and springing forward to locate into a detent?with an added locking mechanism, often a threaded collar or lever, that secures the plunger in place to prevent accidental disengagement due to vibration, shock, or operational forces. These components are commonly manufactured from durable materials such as stainless steel or hardened alloys and are designed to provide reliable, hands-free operation in machinery, fixtures, automation systems, and tooling where accurate alignment and stability are critical.

The global Lockable Indexing Plunger market size was estimated at USD 22.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
