Report Overview

Locking bone screw is an orthopedic screw used for fracture fixation surgery. Unlike traditional screws, locking bone screws have a threaded head that is locked into a plate or rod used to stabilize the bone. This locking mechanism provides greater stability and reduces the risk of screws being pulled out or loosened. Locking bone screws are usually used for situations with poor bone quality, such as osteoporotic bones, or situations that require greater stability, such as comminuted fractures (where bones break into multiple pieces). They are also used in situations where traditional screws may not provide sufficient stability, such as long bone fractures.
