Abstracts

A Logic Sensitive Gate Triac is a specialized type of thyristor designed to be triggered by low-power, logic-level signals, typically compatible with modern digital circuits such as microcontrollers, FPGAs, or TTL/CMOS outputs. Unlike conventional triacs that require higher gate currents and voltages, these devices feature a sensitive gate that can be driven directly by low-current signals, often in the range of a few milliamperes, without the need for intermediate amplification stages like optocouplers or pulse transformers. This makes them particularly suitable for applications in solid-state relays, AC motor control, lighting dimmers, and household appliances where efficient, compact, and cost-effective AC power switching is required. The device operates bidirectionally, allowing control of AC power in both half-cycles, and its sensitivity simplifies circuit design while enhancing reliability and reducing component count in control systems.

The global Logic Sensitive Gate Triac market size was estimated at USD 280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
