## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Lone Worker Alarm competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Lone Worker Alarm production reached approximately 570k units, with an average global market price of around US\$ 95 per unit. The Lone Worker Alarm is a safety device designed for employees working in isolated environments. Its core function is to automatically issue an alarm when a user experiences an emergency such as sudden illness, injury, or disability, triggered manually or by intelligent sensing (such as fall detection or stationary judgment). The system typically consists of three parts: a portable terminal, a communication network, and a monitoring center. The terminal integrates motion sensors and a mobile communication module, enabling real-time tracking of the user's location and posture. Upon detecting an anomaly or receiving a manual distress signal, the terminal immediately sends a multimodal alarm containing the precise location to the monitoring platform. The monitoring center locates the incident through a visual interface and simultaneously initiates voice communication and coordinates with the emergency response team to carry out rescue operations. Upstream, core components are dominated by global giants: sensors rely on Bosch and STMicroelectronics for MEMS motion sensing; positioning/GNSS chips are supplied by u-blox and Qualcomm; and cellular communication modules are mainly provided by Quectel and Fibocom. Downstream applications are highly concentrated, with major engineering giants such as China State Construction Engineering Corporation and Vinci Engineering Corporation purchasing equipment to ensure the safety of employees in high-risk positions. The overall supply chain exhibits a pattern of "concentrated upstream technology and dispersed downstream market," with the Asia-Pacific region holding a core position on both the manufacturing and consumption

ends. The cost structure of the Lone Worker Alarm is centered on hardware components, with communication and positioning modules (approximately 35%), sensors (approximately 20%), and batteries (approximately 15%) constituting the main costs. R&D and software platform amortization account for approximately 15%, while housing structural components and assembly and testing account for approximately 10% and 5%, respectively. As production scales up, the proportion of hardware costs continues to optimize, but the proportion of R&D investment in intelligent algorithms and cloud services for high-end products is significantly increasing. The Lone Worker Alarm has an annual production capacity of 85k units per line, with an industry gross profit margin of 22%-25%.

The global Lone Worker Alarm market size was estimated at USD 54.15 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
