Abstracts

A long-acting GLP-1RA, or Long-acting Glucagon-Like Peptide-1 Receptor Agonist, is a medication designed for the treatment of type 2 diabetes and, in some cases, obesity. It is characterized by an extended half-life, typically requiring only once-weekly injections. Long-acting GLP-1RAs have the ability to enhance insulin secretion from the pancreas and reduce the release of glucagon, thereby lowering post-meal blood sugar levels. Furthermore, they are effective at reducing fasting blood sugar levels and have a more pronounced effect on weight loss. Long-acting GLP-1RA (Glucagon-Like Peptide-1 Receptor Agonist) is experiencing rapid growth in the diabetes treatment sector. The market size is continually expanding, with increasing sales demonstrating its significant potential. Long-acting GLP-1RA medications are favored for their unique effects in improving blood sugar control while aiding in weight reduction, gradually becoming a mainstream choice for type 2 diabetes treatment. Beyond glucose regulation, their specific uses extend to assisting patients in achieving weight management goals. In the future, long-acting GLP-1RA is poised to optimize formulations, mitigate side effects, and broaden its reach to a more diverse patient population, offering more effective and personalized treatment options for diabetes patients worldwide.

The global Long-acting GLP-1RA market size was estimated at USD 20020.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
