Abstracts

Long acting insulin analogues are a class of synthetic insulin formulations engineered to mimic the basal insulin secretion of a healthy pancreas, providing a steady and prolonged glucose-lowering effect with a flatter pharmacokinetic profile and reduced peak activity compared to traditional intermediate-acting insulins, thereby minimizing the risk of hypoglycemia while offering more predictable and consistent glycemic control for patients with diabetes. This category includes molecules such as insulin glargine, insulin detemir, and insulin degludec, which are characterized by their extended duration of action?often exceeding 24 hours?due to modifications such as solubility changes or albumin binding that delay absorption and distribution, making them a cornerstone in the management of both type 1 and type 2 diabetes by serving as a basal insulin foundation upon which mealtime or rapid-acting insulins may be added.

The global Long Acting Insulin Analogue market size was estimated at USD 22000.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
