Abstracts

Long-acting retinal drugs are pharmaceutical agents designed to provide prolonged therapeutic effects in the retina, reducing the frequency of administrations required for eye diseases. These drugs typically utilize advanced delivery systems (such as sustained-release implants, biodegradable polymers, or viral vectors) to maintain therapeutic concentrations in the ocular tissue over extended periods (months to years). They target retinal disorders like age-related macular degeneration (AMD), diabetic retinopathy, and retinal vascular diseases, aiming to minimize patient discomfort, improve compliance, and prevent vision loss by sustaining effective drug action without repeated injections or topical applications.
