Report Overview

A long coherence semiconductor laser is a semiconductor laser with long coherence length and narrow linewidth characteristics. It is a highly optimized design among semiconductor lasers to provide narrow spectrum and coherent light output. The coherence length is the distance over which the coherence of a beam of light remains during propagation. Long coherence semiconductor lasers achieve a longer coherence length by reducing nonlinear effects, reducing noise, and optimizing device structures. The increased coherence length means that the beam remains coherent over longer distances, providing a more stable and clear light output. Narrow linewidth means that the spectral width of the output light of the laser is narrow and has high frequency stability. Long coherent semiconductor lasers achieve narrow linewidth characteristics by optimizing the resonator structure and reducing phase noise. Lasers with narrow linewidth are of great significance in applications such as optical communication, optical sensing, and optical interference, and can provide high-resolution and high-precision measurement and detection capabilities. Long coherent semiconductor lasers are widely used in the fields of optical communication, optical measurement, optical sensing, optical interference and optical coherence tomography. They are used in high-precision and high-performance applications such as light sources in optical fiber communication systems, spectral analysis instruments, optical interferometers, lidars, and optical sensors.

The global Long Coherent Semiconductor Laser market size was estimated at USD 485.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
