## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Long-Wave Cooled Infrared Detectors competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Long-wave cooled infrared detectors are highly sensitive sensors designed to detect infrared (IR) radiation in the long-wave infrared (LWIR) spectral range, typically from 8 to 14 micrometers ( $\mu\text{m}$ ). These detectors are cooled—often using cryogenic methods like Stirling or Joule-Thomson coolers—to reduce thermal noise and improve signal-to-noise ratio, allowing for extremely precise thermal imaging, especially in low-temperature or low-contrast environments. They are commonly based on materials like HgCdTe (mercury cadmium telluride) or InSb (indium antimonide) and are used in advanced applications such as military-grade thermal imaging, space-based observation, scientific instrumentation, missile guidance systems, and surveillance, where high resolution and sensitivity are critical. The cooling system enables these detectors to outperform uncooled variants in terms of detection range, resolution, and image clarity.

The global Long-Wave Cooled Infrared Detectors market size was estimated at USD 202.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
