### Report Overview

A LWIR thermal imaging camera is a device that uses long-wave infrared radiation (typically in the 8 to 14 micron wavelength range) for thermal imaging. It is a variant of infrared thermography that is designed to detect and display the heat distribution on the surface of an object. Compared with infrared thermal imaging cameras in other wavelength ranges (such as mid-wave infrared, short-wave infrared), long-wave infrared thermal imaging cameras have some characteristics and advantages. First, LWIR radiation is able to penetrate fog, smog and some gases in most cases, making thermal imaging effective in harsh environmental conditions. Second, long-wave infrared radiation can better penetrate non-metallic materials such as glass, plastic, and cloth, making observations without special handling or removal of obscuring objects. In addition, long-wave infrared thermal imaging cameras are more sensitive to the detection of low-temperature targets. Long-wave infrared thermal imaging cameras work similarly to other infrared thermal imaging cameras by sensing long-wave infrared radiation emitted by objects and converting it into a visible image. It can display the temperature distribution on the surface of the object, and represent the regions of different temperatures with different colors or brightness. Long-wave infrared thermal imaging cameras are widely used in military, security, fire protection, electric power, construction, medical and other fields. It can be used for various tasks such as personnel search and rescue, fire detection, electrical equipment fault diagnosis, building thermal efficiency assessment, etc.
