### Report Overview

Loop filters have a crucial role in the removal of any kind of high-frequency unnecessary components, which may sometimes get through the phase detector and come out in the VCO (voltage-controlled oscillator) tune line. Further, these will come into view as forged signals on the VCO output. In addition, the loop filters also aid in the VCO to alter its frequency rapidly as required in operations. Moreover, these filters mostly provide the loop stability. The filter design plays an important role for the entire system. If in case the filter design goes wrong, then there are chances that oscillations get built up around the loop, and consequently, large signals are seen on the tune line. Therefore, the VCO will forcibly sweep over huge frequencies bands. To prevent such risky situation, the loop filters with proper designs are used.
