Abstracts

Low adherent wound pads are specialized medical dressings designed to manage exuding wounds by absorbing excess fluid while minimizing trauma to the wound bed upon removal; they typically feature a non-stick, perforated, or silicone-coated contact layer that allows exudate to pass through into an absorbent core, preventing the dressing from adhering to granulating tissue or newly formed epithelium. These products are essential in wound care protocols for conditions such as burns, surgical wounds, and leg ulcers, where reducing pain and protecting fragile healing skin are priorities.

The global Low Adherent Wound Pads market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
