Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low Alkali Cement competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Low alkali cement is a type of cement that contains reduced levels of alkalis, specifically sodium and potassium oxides. The alkali content in cement can have detrimental effects on concrete, particularly in terms of alkali-silica reaction (ASR), which can lead to expansion and cracking over time when reactive siliceous aggregates are used. Low alkali cement is typically specified for structures that will be exposed to conditions where ASR could be a concern, such as in environments with high humidity or where reactive aggregates are present. The reduction of alkali content can mitigate the risks associated with ASR, making concrete more durable and extending its lifespan.

The global Low Alkali Cement market size was estimated at USD 1903.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
