Report Overview

Low Alkaline Borosilicate Glass is a type of glass known for its low concentration of alkali metal oxides, primarily sodium and potassium. It is made by combining boron oxide and silica, which imparts desirable properties like high thermal shock resistance, excellent chemical resistance, and low coefficient of thermal expansion. The reduced alkali content makes it suitable for applications where minimal interaction between glass and the surrounding environment is crucial, such as laboratory glassware, pharmaceutical packaging, and optical devices. This glass type provides a reliable and stable material for industries requiring exceptional durability and resistance to chemical corrosion.
