Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low Carbon Fuels competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Low carbon fuels are fuels whose greenhouse gas emissions are significantly lower than those of traditional fossil fuels throughout their entire life cycle (from raw material production, processing, transportation to final combustion). The upstream of low-carbon fuels involves raw material supply and primary production, including the collection of sustainable biomass (such as waste oil and straw), the production of renewable electricity (for hydrogen production or synthetic fuels), and carbon capture facilities. The midstream is the core conversion and refining process, encompassing biorefineries, electrolyzers, and synthetic fuel plants, which convert raw materials into usable fuel forms (such as renewable diesel, green hydrogen, and e-kerosene). Downstream demand primarily stems from industries constrained by mandatory emission reduction regulations and driven by voluntary carbon neutrality commitments, especially heavy-emission transportation sectors such as aviation, shipping, and long-haul freight, as well as industrial and power generation sectors seeking to decarbonize their energy supplies. The entire industry chain is driven by climate policy, carbon pricing, and declining technology costs, aiming to provide key deep decarbonization solutions for "difficult-to-reduce emission areas." In 2024, the production of low carbon fuels is expected to reach approximately 85 million tons, with an average selling price of approximately US\$1,500 per ton, a gross profit margin of approximately 30%, and a single production line capacity of approximately 600,000 tons per year.

The global Low Carbon Fuels market size was estimated at USD 127500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00%

during the forecast period.
