Abstracts

Low cis polybutadiene rubber is a synthetic elastomer characterized by a low proportion of cis-1,4 configuration in its molecular structure, typically below 40%, which results in distinct properties such as lower elasticity, reduced cold flow, and improved processability compared to its high cis counterpart. This polymer is primarily produced through anionic polymerization using alkyl lithium initiators, allowing precise control over molecular weight and microstructure. Its applications are specialized, often serving as a modifier in plastics like high-impact polystyrene (HIPS) and acrylonitrile butadiene styrene (ABS) to enhance toughness, as well as in adhesives, sealants, and certain tire components where a balance of flexibility, resilience, and compatibility with other materials is required. The material's niche functionality stems from its ability to provide tailored performance in blended systems without compromising thermal stability or chemical resistance.

The global Low Cis Polybutadiene Rubber market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
