Abstracts

A low - code platform is a development platform that enables the rapid creation of applications with little to no coding. It allows developers to build applications through visual programming and model - driven logic, using graphical user interfaces, drag - and - drop components, and pre - built templates. It is based on the principles of model - driven development, automatic code generation, and visual programming. By abstracting the common parts of application development, such as user interfaces, data models, and business logics, into visual models and reusable components, it simplifies the development process. In the future, low - code platforms are expected to be more intelligent and automated, with the application of artificial intelligence and machine learning technologies. For example, they may provide intelligent code suggestions, automated testing, and optimization functions. The application scope of low - code platforms will continue to expand, penetrating into more industries and fields, such as the Internet of Things, smart cities, and healthcare. They will also be more deeply integrated with other emerging technologies. With the increasing attention to data security and compliance, low - code platforms will focus more on security and compliance design, providing more secure data storage, transmission, and access mechanisms to meet the regulatory requirements of different industries and regions.
