## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low Density Ceramsite Proppant competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Low density ceramsite proppant is a man-made granular material designed for hydraulic fracturing in oil and gas wells, particularly where reservoirs have low to moderate closure stresses. It is produced from high-quality bauxite, kaolin, or clay that is pelletized and sintered at high temperature to form round, smooth, and mechanically stable particles. With a bulk density typically around 1.20-1.35 g/cm<sup>3</sup>, this proppant is significantly lighter than conventional high-density ceramics, which allows it to be transported deeper into fractures by fracturing fluids while maintaining good fracture conductivity. Compared with natural sand, low density ceramsite proppant provides higher compressive strength, lower crushing rates, and better sphericity, reducing the risk of fracture closure and fines generation. It is widely used in shallow to medium-depth reservoirs such as shale gas, tight oil, and coalbed methane wells, where its lightweight nature enhances suspension and placement efficiency. Its cost-effectiveness and balance between strength and density make it a preferred choice for operators seeking to optimize recovery while controlling pumping energy and material costs. In 2024, global low density ceramsite proppants production reached approximately 107.81 k tons, with an average global market price of around US\$ 2478 per ton. And global low density ceramsite proppants production capacity reached approximately 160 k tons. The average gross margin in this industry reached 22.49%. Upstream: The low density ceramsite proppant industry primarily depends on raw materials such as high-quality bauxite, kaolin, and clay, which are processed through calcination and sintering to produce lightweight, spherical ceramic particles. Compared with medium- and high-density grades, low density proppants require precise

raw material selection and controlled sintering to ensure sufficient strength while minimizing bulk weight. Key upstream suppliers include Chinalco (bauxite supply), Imerys (industrial minerals), and Almatris (calcined alumina products). Upstream performance is closely tied to raw material cost fluctuations, energy-intensive sintering processes, and environmental compliance in mineral extraction. Downstream: Low density ceramsite proppants are widely used in hydraulic fracturing for shallow to medium-depth oil and gas wells, where lower closure stress allows for lighter proppants while maximizing fracture conductivity and reducing pumping energy. Their cost-effectiveness makes them a preferred alternative to natural frac sand in certain formations. Representative downstream users include Halliburton (oilfield services), Baker Hughes (energy technology), and Sinopec (petroleum exploration and production). With the rising exploitation of unconventional resources and the search for more efficient fracking solutions, downstream demand is driving the market toward proppants with enhanced strength-to-weight ratios, consistent sphericity, and reduced environmental footprint.

The global Low Density Ceramsite Proppant market size was estimated at USD 267.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
