## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Low Density Contrast Medium competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global low density contrast medium production reached approximately 1131 k units, with an average global market price of around US\$ 300 per unit. Low density contrast medium is a special agent used in medical imaging examination. Its core characteristics are lower atomic number and density than human soft tissue. When introduced into the body, it can form a darker area than the surrounding tissue on X-ray or CT images, thereby enhancing the contrast of tissue structure and helping doctors to distinguish organ morphology and lesions more clearly. The annual production capacity of low-density contrast agents is typically 1.3-1.5 million units per year, with a gross profit margin of around 28%. Downstream consumption of low-density contrast agents is as follows: cardiology 48%, interventional radiology 36%, others 16%, aerospace 12%. Market Concentration and Key Players: Internationally, the market concentration of low-density contrast agents is relatively high, mainly concentrated on developed countries in Europe, America and Japan. For example, large manufacturers such as GE and Bayer; from the domestic perspective, low-density contrast agents still have great development space. Manufacturing Processes and Market Trends: The core of the manufacturing process of low-density contrast media is to obtain a stable preparation with appropriate CT negative value and good biocompatibility through precise formulation and special treatment. For example, the preparation of nanoemulsion contrast agent usually involves mixing oil phase, emulsifier, co-emulsion and water phase in a specific ratio, and forming stable emulsion with particle size less than 100 nm through multiple processes such as high-speed stirring and high-pressure homogenization, so as to

ensure uniform CT value and good taste. There have also been studies to prepare low-density contrast agents for gastrointestinal imaging using food-grade raw materials by mechanical agitation. Process control is critical to ensure the stability, safety, and elimination of image artifacts of the contrast agent. In terms of market, the global and China low-density contrast media markets have shown a steady growth trend, driven by the increasing demand for medical imaging diagnosis, aging population and technological progress. The China market has performed significantly. The future trend will focus on product innovation, such as the development of safer and more targeted nano-scale contrast agents and multifunctional composite contrast agents, while policy support for grass-roots medical construction and domestic substitution will bring opportunities for local enterprises. However, the industry also faces challenges such as high R & D costs and fierce international competition. Overall, the low-density contrast media market is promising, driven by both medical needs and technological innovation.

The global Low Density Contrast Medium market size was estimated at USD 339.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
