Report Overview:

Low-density polyurethane foam is a type of polyurethane foam that has a density of less than 1.5 pounds per cubic foot. It is a soft, flexible material that is often used for padding, insulation, and sound absorption.

Low-density polyurethane foam is made by reacting a polyol with an isocyanate. The polyol is a long chain of molecules that contains alcohol groups. The isocyanate is a short chain of molecules that contains nitrogen and carbon groups. When the polyol and isocyanate react, they form a polymer that has a foamy structure.

The density of Low-density polyurethane foam can be controlled by the amount of polyol and isocyanate that is used. A higher ratio of polyol to isocyanate will produce a foam with a lower density.

The Global Low-Density Polyurethane Foam Market Size was estimated at USD 4527.51 million in 2023 and is projected to reach USD 5761.87 million by 2029, exhibiting a CAGR of 4.10% during the forecast period.
