Abstracts

Low dielectric constant materials are substances that have a relatively low ability to store electrical energy in the presence of an electric field, meaning they exhibit a low dielectric constant (also known as relative permittivity). These materials are important in applications where minimizing signal loss and interference is crucial, such as in high-frequency electronics, telecommunications, and microwave devices. Low dielectric constant materials, often used in printed circuit boards (PCBs) and interconnects, help reduce the capacitance between circuits, improve signal integrity, and increase the speed of data transmission. Common examples include certain polymers, ceramics, and composite materials, which are valued for their ability to maintain performance at high frequencies while minimizing power loss and heat generation.

The global Low Dielectric Constant Materials market size was estimated at USD 535.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
