Abstracts

Low E (low emissivity) insulated glass is a specialized glazing product consisting of two or more panes of glass separated by a sealed spacer and filled with an inert gas such as argon or krypton, with one or more glass surfaces coated with a microscopically thin, transparent metallic or metallic oxide layer designed to reflect infrared and ultraviolet light while allowing visible light transmission; this construction significantly reduces heat transfer, improves thermal insulation, minimizes solar heat gain in warm climates, retains interior heat in cold climates, and reduces fading of interior furnishings by blocking harmful UV rays, making it a critical component in energy-efficient building envelopes for both residential and commercial applications.
