Abstracts

Low EEO Agarose is a specially processed agarose product characterized by extremely low electroendosmosis (EEO) properties. EEO measures the tendency of liquid flow under an electric field, and low EEO values indicate more stable electroosmotic flow and more accurate molecular migration during electrophoresis. This agarose is produced from highly purified seaweed extracts, with strict manufacturing controls to remove charged impurities, ensuring high resolution and reproducibility in electrophoretic separations. Low EEO Agarose is widely used for the electrophoretic separation of nucleic acids like DNA and RNA, particularly in experiments requiring precise separation of similarly sized fragments, such as PCR product analysis and restriction enzyme digestion analysis. With moderate gel strength, gelling temperature between 34-38°C, and melting temperature between 85-90°C, it meets the requirements of most molecular biology experiments. Compared to regular agarose, Low EEO Agarose significantly reduces band tailing during electrophoresis, improving separation efficiency, making it an essential tool in molecular biology research.

The global Low EEO Agarose market size was estimated at USD 634.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
