Abstracts

Low Free (LF) isocyanate refers to a type of isocyanate product in which the content of free isocyanate monomers is at a relatively low level. Isocyanates generally refer to compounds containing the isocyanate functional group ($-N = C = O$). Under normal circumstances, isocyanate products may contain a certain amount of unreacted isocyanate monomers. However, low - free isocyanates are produced through special manufacturing processes or post - treatment procedures, which significantly reduce the content of free isocyanate monomers in the products. For example, in the preparation of some high - performance polyurethane materials, the isocyanate raw materials are purified and modified to control the content of free isocyanate monomers within a very low range.

The global Low Free (LF) Isocyanate market size was estimated at USD 495.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
