Abstracts

Low Frequency Heating Systems (LFHS) are electromagnetic induction-based heating solutions designed for industrial, commercial, and select specialized residential applications, utilizing frequencies typically below 10 kHz to generate controlled, uniform heat directly within conductive materials such as metals, composites, or carbon-based elements without direct contact or significant thermal inertia. These systems operate on the principle of eddy current induction, where alternating magnetic fields induce electrical currents within the target material, resulting in rapid and efficient Joule heating that minimizes energy waste and enables precise temperature management for processes like metal hardening, plastic welding, adhesive curing, food processing, or medical sterilization.

The global Low Frequency Heating System market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
