Abstracts

Low Global Warming Potential (Low GWP) blowing agents are chemical compounds used in the production of foam materials such as polyurethane, polystyrene, and phenolic foams to create cellular structures by generating gas during the manufacturing process, resulting in lightweight, insulating products; these agents are characterized by having significantly lower global warming potential compared to traditional blowing agents like hydrofluorocarbons (HFCs) or hydrochlorofluorocarbons (HCFCs), aligning with environmental regulations such as the Kigali Amendment and regional policies (e.g., the F-Gas Regulation in Europe and SNAP in the U.S.) that aim to phase down high-GWP substances. They include alternatives such as hydrofluoroolefins (HFOs), hydrocarbons (e.g., pentane, isobutane), water (which produces CO₂), and natural blowing agents like CO₂ itself, with selection depending on factors such as foam type, required insulation performance, flammability, cost, and regulatory compliance, driving innovation and adoption particularly in construction, appliances, and automotive industries where energy efficiency and sustainability are prioritized.

The global Low Gwp Blowing Agents market size was estimated at USD 1225.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
