Abstracts

Low-hardness water corrosion and scale inhibitors are a class of chemicals specifically used to prevent metal corrosion and scale formation in low-hardness water (soft water). Low-hardness water usually refers to water with less calcium and magnesium ions. Under such water conditions, traditional scale inhibitors may not be able to effectively form a protective film, so special corrosion and scale inhibitors are needed to protect the metal surface from corrosion and scaling. These corrosion and scale inhibitors form a protective film on the metal surface through different mechanisms to block the intrusion of corrosive media and prevent scale formation.

The global Low Hardness Water Corrosion and Scale Inhibitor market size was estimated at USD 102.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
