Abstracts

Low level infeed palletizers are automated material handling systems designed to receive products or cases at floor level or near-ground height, then systematically stack them onto pallets according to predefined patterns, typically using a robotic arm, gantry system, or layer-forming mechanism; these systems are characterized by their ability to handle products conveyed at low elevations, eliminating the need for inclined conveyors or lift mechanisms prior to palletizing, which makes them particularly suitable for operations with space constraints, delicate products requiring gentle handling, or facilities aiming to minimize product elevation changes and associated risks of toppling or damage during the loading process.

The global Low Level Infeed Palletizer market size was estimated at USD 276.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.15% during the forecast period.
