Low Level Laser Therapy (LLLT), also known as photobiomodulation, is a non-invasive medical treatment that utilizes low-intensity lasers or light-emitting diodes (LEDs) to stimulate cellular function, reduce inflammation, and promote tissue repair without generating significant heat or causing damage to tissues. It operates on the principle of photochemical reactions at the cellular level, where specific wavelengths of light are absorbed by mitochondrial chromophores, leading to enhanced adenosine triphosphate (ATP) production, modulation of reactive oxygen species, and activation of various signaling pathways. LLLT is distinguished from high-level laser therapies used for surgical or ablative purposes by its sub-thermal energy output and therapeutic rather than destructive intent, making it applicable across a broad spectrum of conditions, including pain management, wound healing, neurological disorders, and aesthetic procedures.

The global Low Level Laser Therapy market size was estimated at USD 734.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
