Abstracts

Low melting fiber (LMF) is a type of synthetic fiber that has a significantly lower melting point compared to conventional synthetic fibers. It is commonly composed of copolyesters or modified polyolefins, designed to melt at relatively low temperatures ranging from 85°C to 200°C. This characteristic allows LMF to act as a thermally bonding agent in various applications, eliminating the need for chemical adhesives while enhancing product performance. Low melting fibers are typically used in combination with other fibers, such as polyester, polypropylene, or natural fibers, to create composite materials that offer superior durability, elasticity, and resilience. The key function of LMF is to serve as a binder, which, upon heating, melts and forms strong inter-fiber bonds, leading to enhanced mechanical properties of the final product.

The global Low Melting Fiber market size was estimated at USD 2849.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
