Report Overview

Low melting point glass powder, that is, low-melting glass powder. The difference between low-melting point glass powder and ordinary glass powder is that its production formula raw materials are different from glass powder, and its function is better than glass powder. Low-temperature melting glass powder should be distinguished from glass powder. Low-temperature melting glass powder is made of relatively environmentally friendly materials, which are mixed and melted and copolymerized in a high-temperature environment to produce silicon oxide boron metal salts. The powder is an inorganic shaped hard particle, and the raw material is PbO and other heavy metal substances, which undergo a high-temperature solid-state reaction to form a glass homogeneous body with a disordered structure.

The global Low Melting Point Glass Powder market size was estimated at USD 5495.60 million in 2023 and is projected to reach USD 8166.98 million by 2032, exhibiting a CAGR of 4.50% during the forecast period.
