Report Overview:

Low melting point glass powder, that is, low-melting glass powder. The difference between low-melting point glass powder and ordinary glass powder is that its production formula raw materials are different from glass powder, and its function is better than glass powder. Low-temperature melting glass powder should be distinguished from glass powder. Low-temperature melting glass powder is made of relatively environmentally friendly materials, which are mixed and melted and copolymerized in a high-temperature environment to produce silicon oxide boron metal salts. The powder is an inorganic shaped hard particle, and the raw material is PbO and other heavy metal substances, which undergo a high-temperature solid-state reaction to form a glass homogeneous body with a disordered structure.

The Global Low Melting Point Glass Powder Market Size was estimated at USD 5814.87 million in 2023 and is projected to reach USD 7572.47 million by 2029, exhibiting a CAGR of 4.50% during the forecast period.
